

1 · OPERATIONAL PROFILE

AGE / CITY	23 · Monterrey, NL
SITUATION	First job · mid budget
ROLE	Designated buyer (debit / OXXO / SPEI)
DEVICE	Mid-range Android · 1-bar mobile data
BASKET	2–3 contiguous seats
CHANNEL	WhatsApp link → mobile web
SESSION	~9 min end-to-end · active UI under pressure

2 · JOBS TO BE DONE

Lock contiguous seats for his group fast, with the full price known before seat selection, and a digital ticket he can trust at the gate.

GROUP	Freeze contiguous seats before the chat changes its mind or the hold expires.
PRICE	See all-in cost (base + fees + VAT) before entering the seat map.
PAY	Clear, real-time confirmation for debit, OXXO, or SPEI.
ACCESS	Live QR inside the order that works at the door — not a forwarded screenshot.

HYPOTHESIS H2 — FOCUS FOR ENG / PRODUCT

He abandons because the fee is a surprise, not because the amount is high. Showing all-in price early should cut cart drop-off.

Evidence: EventPurchaseClient.tsx:658 labels basePrice as “Total” · calculate-cart already public in pricing.ts · Opportunity 03

KPI · CART

Mobile cart → pay conversion on weak networks

KPI · HOLDS

Lower share of holds expired without purchase

KPI · SUPPORT

Zero “I paid / no ticket” tickets for OXXO-SPEI

3 · CRITICAL FRICTIONS

FRICTION	ROOT CAUSE & IMPACT
Late fee reveal	Event page shows “Total” on basePrice only. Fee + VAT appear in cart. Reads as bait-and-switch → instant abandon. EventPurchaseClient.tsx:658 · pricing.ts
Heavy seat map	Map struggles on one-thumb + weak data. Contiguous seats are hard to lock before the group moves on. web/components/seatmap · ? H2
Rigid hold	Timer keeps running while he confirms in WhatsApp. Seats drop; he fails the group. HoldCountdown (honest clock exists; UX still feels punitive)
OXXO / SPEI fog	Payment sent, status unclear. Anxiety + support load (“did it clear?”). DeferredPaymentPanel · reconcile-spei

4 · PRODUCT REQUIREMENTS

- All-in pricing from first screen**
Render base + fees + VAT on event and map — same number cart will charge. Kill the fake “Total”.
- Hold that survives group chat**
Visible renew + warning under 60s. Server expiry stays source of truth.
- Plain-language OXXO / SPEI status**
States like “Waiting for payment” / “Payment verified” — not bank jargon.
- Live QR on the order**
QR regenerates inside the order; static captures must not pass at the gate.

LAST-MINUTE BUYER

Iván Solís

Fast ticket buy under weak mobile data and a group deciding in WhatsApp. Focus minute: fee surprise on the way to cart (journey phase 3).

CONTEXT

Friday 7:40 pm · bus · 1 signal bar · event tomorrow · 2-3 tickets

THINKS & FEELS

01

- Anxious the seats will vanish if the map is slow.
- Angry when fees appear only at the end — feels cheated even if the fee is fair.
- Expects checkout to feel as fast as sending a WhatsApp message.
- Afraid of paying via OXXO/SPEI and the system not registering the ticket in time.

SEES

02

- Friends organizing last-minute plans in group chats.
- Ticketing pages with seat maps that load poorly on phone data.
- Event ads whose price jumps hard at checkout.
- A “Total” label that is not actually the amount he will pay.

HEARS

03

- “You get the tickets — we’ll transfer you later.”
- “That site always dies when it’s on sale.”
- “Together or don’t bother.”
- Someone pasting a reseller link as a “cheaper” option.

SAYS & DOES

04

- Buys on mobile while commuting or multitasking.
- Screenshots the screen and asks the chat “yes or no?” before paying.
- Compares the new total to resale or another app.
- Abandons immediately if the price jumps — then texts “couldn’t get them.”

PAINS

1. Losing contiguous seats to a hold that expires while the group debates.
2. Surprise fees at the end that blow a tight monthly budget.
3. Weak signal that blocks map use — or showing the QR at the gate.

GAINS

1. Final price visible from the first tap — no bait-and-switch feel.
2. Immediate, unambiguous payment confirmation (debit / OXXO / SPEI).
3. Ticket available when signal is bad: live QR on the order, usable at the door.
